

**“Allocation and Assignment of Radio-Spectrum  
Resources by using Price Mechanism:  
Proposals for a New System”**

---

WORKSHOP on Advanced Wireless Technologies:  
Implications for Spectrum Management  
European Commission, DG Information Society, IST Program  
Brussels, 10/10/2003  
Hajime ONIKI  
Osaka-Gakuin University, Japan  
oniki@alum.mit.edu  
[www.osaka-gu.ac.jp/php/oniki/](http://www.osaka-gu.ac.jp/php/oniki/)

**Contents:**

---

- I. Introduction and Background**
- II. Present System of Spectrum Utilization**
- III. Provision for Spectrum Commons as a Public Good**
- IV. Re-allocation of Spectrum Bands with Compensation  
-----An Insurance-Compensation System with Proper  
Incentives**
- V. Re-assignment of Spectrum Blocks ----- Modified  
Lease Auction (MLA)**

## **Contents:**

---

### **VI. Gradual Transition to MLA**

### **VII. Conclusion**

H. Oniki

10/10/2003

## **I. Introduction and Background**

---

### **A. History of spectrum use: technological progress**

### **B. Administration of spectrum resources**

### **C. Emergence of spectrum shortage**

H. Oniki

10/10/2003

## **A. History of spectrum use: technological progress**

---

- 1. Early 20-th century  
used for maritime navigation  
navy operations**
- 2. 1920's  
voice-radio broadcasting**
- 3. 1930-40's  
military use, radars**

H. Oniki

10/10/2003

## **A. History of spectrum use: technological progress**

---

- 4. 1950's  
television broadcasting, FM radio**
- 5. 1960's ~ present  
many applications including mobile  
telephony,  
wireless Internet, etc.**

H. Oniki

10/10/2003

## **B. Administration of spectrum resources**

---

- 1. Command and control by country government (“socialist system”)**
  - a. introduction of new technology to expand the frontier of spectrum use**
  - b. assignment of new spectrum blocks to users with zero usage price**
  - c. prevention of interferences**

H. Oniki

10/10/2003

## **B. Administration of spectrum resources**

---

- 2. Allocation and assignment of spectrum**
  - a. spectrum allocation by**
    - international organizations (ITU, EC)**
    - country government**
  - b. spectrum assignment (licensing) by country government zero price to users**

H. Oniki

10/10/2003

## **C. Emergence of spectrum shortage**

---

- 1. End of spectrum-frontier expansion**  
**no more spectrum band of “good quality”**  
**upper limit: 3-5 GHz**

H. Oniki

10/10/2003

## **C. Emergence of spectrum shortage**

---

- 2. Attempts to use price mechanism in assigning spectrum blocks**
  - a. new licensing on auctions (US: 1993 ~ , EU: 2000 for G3, etc.)**
  - b. spectrum usage fees**

H. Oniki

10/10/2003

## **C. Emergence of spectrum shortage**

---

### **2. Attempts to use price mechanism in assigning spectrum blocks**

#### **c. problems:**

**spectrum “bubbles” (high price)  
spectrum may become a private  
property  
spectrum fees may be only nominal**

## **C. Emergence of spectrum shortage**

---

### **3. Attempts to re-allocate/re-assign spectrum bands**

#### **a. international negotiations**

**b. re-allocation by country government  
Japan (2003 ~ for wireless LAN)  
by command and control**

## **C. Emergence of spectrum shortage**

---

### **3. Attempts to re-allocate/re-assign spectrum bands**

#### **c. problems:**

**slow and costly negotiations  
creates risk and uncertainty to  
incumbents  
generates regulatory complexities  
extreme inefficiencies continue to  
remain**

## **C. Emergence of spectrum shortage**

---

### **4. Emergence of new technologies**

**a. possibility of “spectrum commons”  
spread spectrum, underlay, UWB,  
software radio**

## C. Emergence of spectrum shortage

---

### 4. Emergence of new technologies

#### b. observation:

**significant increase in spectrum capacity**

**new technologies are created for using “unlicensed bands”**

**proposals of open use to replace licensing (“commons” campaign)**

## II. Present System of Spectrum Utilization

---

### A. Spectrum as an economic resource

### B. Allocation of spectrum bands (ALLOC)

### C. Assignment of spectrum blocks (ASSGN)

### D. The challenge in the age of spectrum shortage

## **A. Spectrum as an economic resource**

---

### **1. One of space resources**

#### **a. physical spaces:**

**land, water surface, aviation space,  
satellite orbits, etc.**

#### **b. electromagnetic spaces:**

**radio spectrum, optical spectrum.**

## **A. Spectrum as an economic resource**

---

### **2. Non-reproducible natural resource**

#### **a. does not deplete**

**(unlike mineral, oil deposits)**

#### **b. does not depreciate**

**(unlike machines, equipment)**

## **A. Spectrum as an economic resource**

---

- 3. Physical capacity limit boundary and size**
- 4. Technology and capital for using spectrum**
  - a. technological progress leads to capacity increase**
  - b. substitution between capital and spectrum size**

## **A. Spectrum as an economic resource**

---

- 5. Modes of utilization**
  - a. Exclusive use**
  - b. Club use**
  - c. Commons use**

## **A. Spectrum as an economic resource**

---

- 6. Positive externalities  
scale economy**
- 7. Negative externalities  
interferences, congestions**
- 8. Illustration <Figure 1>**

## **B. Allocation of spectrum bands (ALLOC)**

---

- 1. Outline**
  - a. *zoning* of spectrum**
  - b. two-level system:  
country and international**
  - c. no price mechanism is used  
command and control  
direct negotiations**

## **B. Allocation of spectrum bands (ALLOC)**

---

### **2. Items to be specified**

- a. objective**
- b. priority**
- c. usage mode**
  - exclusive, club, commons**
  - (unlicensed, open use)**
- d. technical items**

## **B. Allocation of spectrum bands (ALLOC)**

---

### **3. Two-level specification**

- a. international level**
  - negotiations in ITU, EC**
- b. country level**
  - command and control (beauty contest)**

## **B. Allocation of spectrum bands (ALLOC)**

---

### **4. Re-allocation**

**a. by international negotiations**

**b. with insurance-compensation system\*  
(IV)**

## **B. Allocation of spectrum bands (ALLOC)**

---

### **5. Problems-----difficulties in re-allocation**

**a. international negotiations are difficult**

**b. negotiation with incumbents are difficult**

### **6. Illustration <Figure 2>**

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **1. Outline**

- a. specification of actual user(s) of spectrum blocks licensing**
- b. executed by country government**

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **2. Items to be specified to users**

- a. spectrum blocks**
- b. duration of license**
- c. priority, time of use**
- d. emission power, technical items**

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **3. Exclusive use----alternative systems for ASSGN**

#### **a. Traditional system**

**assignment by country government**

**comparative hearings (beauty contest)**

**lotteries**

**zero or nominal rent**

**automatic (or likely) renewal of**

**license at expiration**

H. Oniki

10/10/2003

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **3. Exclusive use----alternative systems for ASSGN**

#### **b. Private-property (or semi-private property)**

**system**

**assignment with auction**

**competitive price paid in one installment**

**automatic (or likely) renewal**

H. Oniki

10/10/2003

## C. Assignment of spectrum blocks (ASSGN)

---

### 3. Exclusive use----alternative systems for ASSGN

#### c. Competitive lease system \*(V.)

assignment by country government with  
 auction on lease price  
 competitive lease price paid  
 re-assignment with auction at expiration  
 no automatic renewal  
 modifications in favor of incumbents

H. Oniki

10/10/2003

## C. Assignment of spectrum blocks (ASSGN)

---

### 4. Club use

#### a. Traditional system

licensing by country government  
 unlimited entry  
 zero or nominal rent  
 automatic renewal  
 examples: amateur wireless, navigation, aviation

#### b. *privatized* club use \*(III.)

H. Oniki

10/10/2003

## C. Assignment of spectrum blocks (ASSGN)

---

### 5. Commons-----open use

#### a. traditional system

**no licensing**

**power limit**

#### b. commons as a public good \*(III.)

H. Oniki

10/10/2003

## C. Assignment of spectrum blocks (ASSGN)

---

### 6. Problems

#### a. Exclusive use under traditional system

**low-efficiency uses continue to remain**

**new entry is difficult**

**competition is precluded**

**no incentive to save spectrum**

**low incentive for technological progress**

H. Oniki

10/10/2003

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **6. Problems**

#### **b. Exclusive use under private-property system**

**“spectrum hold-up” may occur**

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **6. Problems**

#### **c. Club use under traditional system**

**congestion may occur**

**re-assignment (re-allocation) is difficult**

**because of the involvement by many users**

## **C. Assignment of spectrum blocks (ASSGN)**

---

### **6. Problems**

- d. Commons under traditional system  
re-assignment (re-allocation) is difficult  
because of the involvement by many users**

### **7. Illustration <Figure 2>**

H. Oniki

10/10/2003

## **D. The challenge in the age of spectrum shortage**

---

### **1. Present state**

**incumbent users with vested interests**

**free and continuing use**

### **2. Need for re-allocation**

**emergence of new objectives for spectrum use**

H. Oniki

10/10/2003

## **D. The challenge in the age of spectrum shortage**

---

- 3. Need for re-assignment**  
new users, new business
- 4. Need for accommodating new technologies**  
for spectrum sharing
- 5. *The challenge***  
*gradual but steady improvement*

H. Oniki

10/10/2003

## **III. Provision for Spectrum Commons as a Public Good ( A Proposal)**

---

### **A. Outline**

### **B. Proposals \***

H. Oniki

10/10/2003

## A. Outline

---

1. **Technology for spectrum sharing**
  - a. **to increase efficiency and flexibility by sharing a spectrum block with many users**
  - b. **new technology**  
**SS, CDMA, underlay, UWB**

H. Oniki

10/10/2003

## A. Outline

---

1. **Technology for spectrum sharing**
  - c. *old technology*  
**amateur wireless, navigation use, aviation use**
  - d. **commons for using land space**  
**public parks, street roads, town commons**

H. Oniki

10/10/2003

## A. Outline

---

### 2. Outcome from using commons:

- a. depends on demand (number of users) and supply (capacity of spectrum block)
- b. efficient use with *ample capacity*
- c. congestion with *capacity shortage*
- d. outcome may change in the long run from free use to congestion

## A. Outline

---

### 3. Observation

- a. spectrum sharing under direct governmental control (Mode-G)  
commons: ISM  
clubs: navigation and aviation,  
outdoor wireless-LAN

## A. Outline

---

### 3. Observation

#### b. Spectrum sharing under private licensee's control (Mode-L)

**commons:**

**free broadcast to viewers**

**clubs: mobile telephony,  
pay-per-view broadcast**

H. Oniki

10/10/2003

## A. Outline

---

### 3. Observation

**c. mode-G commons may lead to  
congestion and inefficient use,  
but re-allocation is difficult  
need for creating a system with easy  
re-allocation**

H. Oniki

10/10/2003

## **B. Proposals\***

---

### **1. Preference of Mode-L to Mode-G for spectrum sharing**

- a. strong incentives for efficient use**
- b. convenience for re-allocation and re-assignment**

## **B. Proposals\***

---

### **2. Mode-L spectrum sharing**

- a. assign spectrum blocks exclusively to private licensees**
- b. let the licensees supply spectrum blocks to end users in club or commons**
- c. examples**
  - outdoor wireless LAN**

## B. Proposals\*

---

### 3. Mode-G spectrum sharing (spectrum as a *public good*)

- a. establish a *public agent* to administer Mode-G spectrum clubs or commons

**to avoid formation of unlimited rights  
of using spectrum**

H. Oniki

10/10/2003

## B. Proposals\*

---

### 3. Mode-G spectrum sharing (spectrum as a *public good*)

- b. let the *public agent* supply spectrum blocks to end users in clubs or commons  
the cost for the agent to secure the blocks may be paid from government budget  
(along with paying for other public goods)  
(V.)

H. Oniki

10/10/2003

## B. Proposals\*

---

### 3. Mode-G spectrum sharing (spectrum as a public good)

- b. let the public agent supply spectrum blocks to end users in clubs or commons  
the agent administers insurance-compensation for re-allocation\* (IV.)  
Mode-G commons become a *public good*

## B. Proposals\*

---

### 3. Mode-G spectrum sharing (spectrum as a public good)

- c. examples (over direct termination of license):  
ISM, indoor wireless LAN
- d. advantages:  
reveal the opportunity cost of spectrum  
bands/blocks supplied as a public good  
create a representative of users' interests  
re-allocation, re-assignment will be easier

## B. Proposals\*

---

### 3. Mode-G spectrum sharing (spectrum as a public good)

- e. observation on Mode-G commons would be the same as present-day unlicensed blocks if operated under government command and control would become a free good if spectrum capacity exceeds demand because of technological progress but otherwise would turn to a public goods

## B. Proposals\*

---

### 4. Illustration <Figure 3>

## **IV. Re-allocation of Spectrum Bands with Compensation -----An Insurance-Compensation System with Proper Incentives**

---

- A. Outline**
- B. Insurance-compensation system for re-allocation within a country\* (a proposal)**
- C. International insurance-compensation system for spectrum re-allocation\* (a proposal)**

## **A. Outline**

---

- 1. Re-allocation of spectrum bands**
  - a. need arises from technological progress and changes in demand**
  - b. shortage of spectrum bands to meet new demand**
  - c. shortage is a global (frequency-wise) problem over all spectrum bands**

## A. Outline

---

### 1. Re-allocation of spectrum bands

- d. re-allocation is to be made locally with a single band
- e. a band to be re-allocated is a “sacrifice” for the benefit of other users
- f. need for compensation to outgoing users at re-allocation, the cost should be paid by all users

## A. Outline

---

### 2. Compensation

#### a. *acceptable compensation*

the least amount of money for which a spectrum user to accept termination of using a block; the user moves from current activity X to new activity Y accordingly.

## A. Outline

---

### 2. Compensation

#### b. determination:

(acceptable compensation)

= (present value of activity X)

- (present value of activity Y) + Q

**Q = once-and-for-all cost of moving from X to Y**

## A. Outline

---

### 2. Compensation

#### c. compensation would be needed regardless of the system of assignment:

**command and control, property system,  
competitive lease, Mode-L or Mode-G  
commons / clubs.**

## A. Outline

---

### 2. Compensation

- d. **compensation in kind under command and control:**
  - part of compensation is made in the form of providing spectrum at some band:**
  - acceptable compensation need to be declared for each specification of compensation in kind.**

**example:**

**X = 1MHz in the 2GHz band**

**Y = 2MGz in the 15GHz band**

H. Oniki

10/10/2003

## B. Insurance-compensation system for re-allocation within a country (a proposal)

---

### 1. Acceptable compensation and premium

- a. **acceptable compensation**
  - to be declared by each spectrum user**

H. Oniki

10/10/2003

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

- 1. Acceptable compensation and premium**
  - b. annual compensation premium to be paid by each spectrum user annually to spectrum manager (country government)**  
**= (declared acceptable compensation) times (premium rate)**

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

- 2. Premium rate and government budget**
  - a. premium rate**  
**to be determined by spectrum manager so that the total annual income from the compensation premiums be equal to the total annual compensations paid for the re-allocation in the year.**

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

### **2. Premium rate and government budget**

#### **b. implications**

**actuarially fair insurance**

**balanced budget for spectrum re-allocation**

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

### **3. Determination of spectrum bands to be re-allocated**

- a. indicator of efficiency increase from re-allocating a band:  $= (B - C) / A$ , where**
- A = (present value of using the band under old objective)**
- B = (present value of using the band under new objective)**
- C = (amount of compensation for the re-allocation)**

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

- 3. Determination of spectrum bands to be re-allocated**
  - b. maximum efficiency indicator**  
the band with the highest efficiency indicator (which exceeds 1) is to be chosen for re-allocation  
an incentive for honest declaration of acceptable compensation by users

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

- 4. Determination of data A and B for re-allocation**
  - a. under command and control**  
country government needs to estimate both A and B

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

### **4. Determination of data A and B for re-allocation**

#### **b. under property system**

**A and B may be obtained from appropriate market transactions if such take place, otherwise country government needs to estimate them.**

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

### **4. Determination of data A and B for re-allocation**

#### **c. under competitive lease**

**A can be calculated from current lease price, B can be calculated if there is a block being used for the new objective, otherwise it need to be estimated.**

## **B. Insurance-compensation system for re-allocation within a country (a proposal)**

---

### **5. Illustration <Figure 4>**

H. Oniki

10/10/2003

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

- 1. Group of country governments for international insurance-compensation system (GIIC)**
  - a. to be formed voluntarily by country governments**
  - b. objectives:**
    - to administer international insurance-compensation for re-allocation to reveal information of the supply price of spectrum bands via compensation**

H. Oniki

10/10/2003

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

- 2. Acceptable compensation and premium**
  - a. to be declared by each member country for each band**
  - b. annual compensation premium to be paid by each member country annually to GIIC  
= (declared acceptable compensation) times (premium rate).**

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

- 3. Premium rate and determination/recommendation of spectrum bands to be re-allocated internationally**
  - a. premium rate to be determined by GIIC so as to balance its annual budget**
  - b. indicator of efficiency increase from re-allocating a band internationally (same as in V.B.3.a)**

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **3. Premium rate and determination/recommendation of spectrum bands to be re-allocated internationally**

- c. maximum efficiency increase the band with the highest efficiency indicator (which exceeds 1) is to be chosen for re-allocation**

H. Oniki

10/10/2003

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **3. Premium rate and determination/recommendation of spectrum bands to be re-allocated internationally**

- d. GIIC executes or recommends (to ITU, EC) the choice of the band (in c. above) pays compensation to each member country according to re-allocation agreement made in ITU, EU.**

H. Oniki

10/10/2003

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **4. Behavior of a member country of GIIC**

- a. member country with a domestic insurance-compensation system operates with two *accounts*:**

H. Oniki

10/10/2003

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **4. Behavior of a member country of GIIC**

**with GIIC system:**

**represents GIIC to domestic users as a (neutral) intermediary**

**domestic users deal in effect directly with GIIC**

**decreases incentive for dishonest declaration of acceptable compensation by users**

H. Oniki

10/10/2003

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **4. Behavior of a member country of GIIC**

**with domestic insurance-compensation system for domestic re-allocations:**

**users pay annual premium both to GIIC  
and domestic government  
domestic budget will be balanced**

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **4. Behavior of a member country of GIIC**

**b. member country without a domestic insurance-compensation system**

**needs to estimate acceptable compensation for each band  
budget from paying premiums and receiving compensations need not balance**

## **C. International insurance-compensation system for spectrum re-allocation (a proposal)**

---

### **5. Illustration <Figure 5>**

H. Oniki

10/10/2003

## **V. Re-assignment of Spectrum Blocks ----- Modified Lease Auction (MLA)**

---

**A. ASSGN by means of (simple) lease auction (LA)**

**B. Accommodation of various usage modes within the  
system of LA**

H. Oniki

10/10/2003

## **V. Re-assignment of Spectrum Blocks ----- Modified Lease Auction (MLA)**

---

**C. Disadvantages of LA**

**D. Protecting incumbents against ROD to an  
appropriate degree**

**E. Further consideration of ROD**

**F. Remarks**

H. Oniki

10/10/2003

## **A. ASSGN by means of (simple) lease auction (LA)**

---

- 1. Spectrum resources owned by government and leased to spectrum users (managers), private or public, by auction; lease to be applied to all users including government users ----- no exception  
give incentive to save spectrum use**

H. Oniki

10/10/2003

## **A. ASSGN by means of (simple) lease auction (LA)**

---

- 2. Auction for each spectrum block --- frequency range, geographical area, time, priority**
- 3. Resale of licenses ----- permitted within ALLOC and AGGN specifications**

H. Oniki

10/10/2003

## **B. Accommodation of various usage modes within the system of LA**

---

### **1. Exclusive use:**

**winner of auction become the user**

### **2. Club use:**

**winner of auction represent the share**

**users**

H. Oniki

10/10/2003

## **B. Accommodation of various usage modes within the system of LA**

---

### **3. Commons use:**

#### **a. type-1 ("unlicensed" use)**

**winner of auction of primary exclusive right  
become the manager of the union of, e.g.,  
suppliers of devices using the spectrum; union  
membership should be open and members pay the  
lease prices**

## **B. Accommodation of various usage modes within the system of LA**

---

### **3. Commons use:**

#### **b. type-2 ("overlay" including UWB)**

**winner of auction of secondary right  
become the manager of the union of  
suppliers of devices, etc.**

## **B. Accommodation of various usage modes within the system of LA**

---

- 4. Government may support commons use**  
**government agent may bid and win auction;**  
**the lease price is paid by government;**  
**an upper limit of lease price is specified prior**  
**to auction**

## **C. Disadvantages of LA**

---

- 1. Risk of lease discontinuation (ROD) to spectrum users**  
**arising from newcomers outbidding incumbents**
- 2. Cost of administering auctions**

## **D. Protecting incumbents against ROD to an appropriate degree**

---

### **1. Against ROD :**

- a. discount of lease price to incumbents**
- b. auction to be held years before the beginning of license period**

H. Oniki

10/10/2003

## **D. Protecting incumbents against ROD to an appropriate degree**

---

### **1. Against ROD :**

- c. use of “pre-auction” (winners obtain discount)**
- d. creation of futures and options markets for leasing spectrum**

H. Oniki

10/10/2003

## **E. Further consideration of ROD**

---

### **1. Economic meaning of ROD**

- a. the other side of economic growth**
- b. a price of having flexibility in spectrum use**
- c. no ROD in stationary (stagnant) economy**

## **E. Further consideration of ROD**

---

### **2. The degree of ROD**

- a. determines the balance between the security to  
incumbents and the chance of entry by newcomers**
- b. optimum to be found by trials and errors**

## **E. Further consideration of ROD**

---

### **2. The degree of ROD**

**c. zero: allocation by central planning (assignment  
by government with automatic renewals)**

**low: auction on the right to use spectrum  
permanently**

**medium: MLA**

**high: LA**

H. Oniki

10/10/2003

## **E. Further consideration of ROD**

---

### **3. Illustration <Figure 6>**

H. Oniki

10/10/2003

## F. Remarks

---

1. **Why not perpetuity (property ownership system) ?**
  - a. **presence of externalities (scale economies) in the use of spectrum**
  - b. **Coase's theorem does not work because of uncertainty and bargaining time/cost (for Nash equilibrium with different information sets)**

H. Oniki

10/10/2003

## F. Remarks

---

2. **Why not LA? (why are the modifications needed?)**
  - a. **with incomplete and costly information, prevalence of ROD may not be optimal.**
  - b. **positive economics for determining "optimal degree of protection against ROD"?**  
  
**--- a subject for future research.**

H. Oniki

10/10/2003

## **VI. Gradual Transition to MLA**

---

### **A. Overview**

### **B. Transition**

### **C. Income Compensation**

### **D. Forecast**

H. Oniki

10/10/2003

100

## **A. Overview**

---

### **1. Need for gradual and informed transition**

- a. cost of transition arising from the presence of capital stock and human skills fitted to the old system**
- b. information about the overall transition process is needed for the formation of transition plan by spectrum users**

H. Oniki

10/10/2003

## A. Overview

---

### 2. policies for transition

- a. formation of "benchmark lease price (BLP), a proxy of market price"
- b. gradual increase in usage fees from the current level (=0) to the market price (=BLP)
- c. provisions for income compensation

## B. Transition

---

### 1. Preparation period (M years)

- a. MLA to be applied to new assignments  
zero usage fees to incumbents
- b. BLP: to be set at auction prices if available, else to be calculated by interpolation-periodic revisions

## B. Transition

---

### 2. Execution period (N years)

#### a. MLA to new assignments

#### b. partial lease price (PLP), equal to $((n/N) * BLP)$ , to be paid by incumbents in n-th year ( $n=1,2,\dots,N$ ); no ROD to incumbents

H. Oniki

10/10/2003

## B. Transition

---

### 3. Completion of transition process

#### a. traversing smoothly to full-scale MLA

#### b. all licenses to be issued under MLA with payment of full lease price (FLP) thereafter

#### c. resale of licenses permitted

### 4. Illustration <Figures 7, 8>

## C. Income Compensation

---

### 1. Overview

- a. (possible) compensation to incumbents for the payment of PLP and FLP
- b. complete separation of spectrum usage and income distribution

## C. Income Compensation

---

### 2. Determination of compensation

- a. compensation period :  $t=1,2, \dots, T$ ; no compensation for  $t > T$
- b. base amount of payment (BAP): the value of the spectrum held at  $t=0$  evaluated in terms of current PLP or FLP, whichever applied.

## C. Income Compensation

---

c. the degree of compensation for period  $t$ ,  $d(t)$ ;

$$0 \leq d(t) \leq 1 \text{ for } 0 \leq t \leq T;$$

$$d(t) = 0 \text{ for } t > T.$$

d. linear sunset:

$$d(t) = (T - t)/T \text{ for } 0 \leq t \leq T;$$

$$d(t) = 0 \text{ for } t > T.$$

## C. Income Compensation

---

3. Policies for compensation:

a. government determines  $g$  for each user category

near-full compensation: military and security users ( $g=1$ )

partial compensation : government users, public utilities,  
public

transportation operators, welfare agents, etc. ( $g=0.5$ )

no compensation : profit-seeking entities, individual users  
( $g=0$ )

## C. Income Compensation

---

### 3. Policies for compensation:

#### b. actual amount of compensation in period $t$ :

$AAC(t)$

$$AAC(t) = g * d(t) * BAP(t),$$

$$0 \leq AAC(t) \leq BAP(t), \quad t = 1, 2, \dots, T.$$

## C. Income Compensation

---

### 4. Neutrality

**choice of a degree of compensation  $d(t)$  does not affect the incentive to save and release spectrum by incumbents**

## D. Forecast

---

- 1. increase in lease price in the preparation period  
because of unbalanced usages still remaining**
- 2. gradual decrease in the execution period and  
afterward  
because of “leveled” usage**
- 3. lease price will approach to zero in the long run (?)  
depends technology and demand in the future**
